## **SECTION 1: PROJECT OVERVIEW**

The proposed Brodie Plat project is comprised of parcel numbers 30052500302300, 30052500303800, and 30052500303900, and proposes the construction of 45 single family lots with associated utilities, ROW, and open spaces on a 10.02-acre site. There are frontage improvements proposed on the site along 60<sup>th</sup> St NE, and access to the site will be from 60<sup>th</sup> St NE. The site is located within the SW ¼ of the SW ¼ of Section 25, Township 30 N, Range 05 E, W.M. The project address is 8719 60<sup>th</sup> St NE Marysville, WA 98270. See the Vicinity Map in Appendix 1 for visual representation of the subject property.

### **Existing Site**

The parcel 30052500303800 is currently occupied by a cellular tower in the east and a cargo shipping storage container in the center of the parcel. The shipping container on site will be removed, and the cell tower will remain in Tract 996 with access from the public ROW. The site is bordered to the west by R18 (Multi-Family Medium) zoned land, to the north by Recreation zoned land, and to the south by R6.5 (Single Family High) zoned land. The project parcels are currently zoned Recreation and a rezone to R-18 zoning is proposed for the project site. Existing ground cover is a combination of trees, grass, and gravel.

The proposed development will exist within the bounds of the Onsite Basin and the frontage along 60<sup>th</sup> St NE. In the existing condition, the site discharges to the onsite wetland and conveyances north and west offsite. See Predeveloped and Developed Hydrology Maps in Appendix 4 for a visual representation of these basins. The project site includes a stream area and wetlands areas that are along the westerly portion of the site. Buffer averaging is proposed.

Site soils are classified as about 27% Norma loam and about 73% Tokul gravelly medial loam (where about 25% is at 0 to 8 percent slopes, about 39% is at 8 to 15 percent slopes, and about 9% is at 15 to 30 percent slopes). See the Soils Map in Appendix 3 for visual layout of soil type areas of the subject property. According to the Marysville topographic map, the existing site slopes are generally sloping from northeast to southwest. Due to till soils present onsite, the Geotechnical Engineer does not recommend infiltration for LID BMPs to be used onsite.

### **Proposed Development**

The proposed Brodie Plat project will develop associated utilities, driveways, ROW, landscaping, and open spaces. Stormwater will be mitigated via a detention and water quality treatment system and bypass basin. Onsite development will disturb 6.46 acres of area that will be collected to the detention vault for mitigation and stormwater quality treatment, while frontage improvements will impact an additional 0.56 acres within the 60<sup>th</sup> Ave dedicated ROW a portion of onsite ROW that cannot be collected to the detention vault but will be treated for stormwater quality treatment.

### **Proposed Drainage System**

This project is subject to the requirements of the 2014 Stormwater Management Manual for Western Washington (DOE Manual). In compliance with 2014 DOE Manual, all runoff from developed/disturbed surfaces must be collected, treated, and released to natural drainage courses unless it is dispersed or infiltrated.

Proposed pollution generating impervious surfaces (PGIS) will exceed the 5,000 SF threshold and thus basic water quality treatment will be provided via a water quality treatment structure that treats stormwater runoff from roadways and driveways.

The disturbed area of the development is contained within the Onsite Basin and the Bypass Basin. The Onsite Basin consists of onsite developed roof, landscape, sidewalk, pavement and driveway. This project is required to meet flow control requirements which are achieved by a detention vault in the

northwestern portion of the site. Developed condition stormwater associated with the Onsite Basin will be collected within the detention vault and released directly into Grace Creek, which is located directly south of and parallel to Allen Creek, after treatment in the proposed Perfilter. Developed condition stormwater associated with the Bypass Basin will be treated by a Perfilter and dispersed. See Section 4.0 for additional discussion regarding proposed stormwater management and water quality treatment measures.

### **Erosion/Sedimentation Control**

Erosion control measures that will be utilized during construction will include a combination of silt fence, storm drain inlet protection, interceptor swales, and sediment pond. See Section 2.0 for discussion of how SWPPP Elements are addressed.

### **Minimum Requirements**

Per the 2014 DOE, Minimum Requirements 1-9 apply to the proposed development.

#### *Minimum Requirement #1: Preparation of Stormwater Site Plans*

A report along with the construction plans, to be submitted at a later date, satisfies the minimum requirement.

#### *Minimum Requirement #2: Construction Stormwater Pollution Prevention*

See Section 2 of this Report for the SWPPP BMP Elements, and the SWPPP (submitted as a separate document) for a complete discussion of erosion control BMP's and their use specific to the site.

#### *Minimum Requirement #3: Source of Pollution*

Permanent source control BMPs are not applicable for the subject site since the associated activities for the new residence do not fall within the types of facilities listed within Volume IV of the DOE Manual (Residential developments are not required to implement source control BMP's). BMPs for erosion and sedimentation control are specified in the Construction Plans and the SWPPP.

#### *Minimum Requirement #4: Preservation of Natural Drainage Systems and Outfalls*

Flow from the site will preserve its natural drainage pattern from the southeast to the northwest. Runoff flows towards Grace Creek and continues northwest before leaving the quarter mile buffer of analysis.

#### *Minimum Requirement #5: On-Site Stormwater Management*

The project will exceed the 10,000 SF PGHS threshold and is required to provide an Onsite Stormwater BMP. A detention vault will be installed in the northwestern end of the site and will discharge at a historic, mitigated rate that will be dispersed into native vegetation in Tract 999.

#### *Minimum Requirement #6: Runoff Treatment*

As the project will exceed the 5,000 SF threshold of PGHS, the project is required to provide "basic" water quality treatment per the 2014 DOE manual. A Perfilter water quality treatment unit will be installed downstream of the detention vault to meet this requirement and Modular Wetland unit will be installed along the 60<sup>th</sup> St NE frontage. Runoff from public ROW facilities will not be treated by the proposed on-site Perfilter, which will be privately owned and maintained.

#### *Minimum Requirement #7: Flow Control*

A detention vault is proposed at the northwestern end of the site to control flows and release at historic, mitigated rates. Please see Section 4.0 for additional flow control modeling and parameters for detention sizing.

#### *Minimum Requirement #8: Wetlands Protection*

Wetlands exist onsite and have been given 100' buffers. Buffer averaging is proposed. The dispersion facility discharges from the Bypass Basin and the detention vault outfall are proposed within the outer 25% of the revised buffer line. Please see sheet RD-01 of the plan set for location information. Wetland areas will not be disturbed during site construction and will be protected with silt fencing and other BMPs throughout construction.

*Minimum Requirement #9: Operation and Maintenance*

See Operations and Maintenance in Section 6 of this report.

## **SECTION 2: TEMPORARY EROSION AND SEDIMENT CONTROL DESIGN**

### **SWPPP Design Elements**

A Stormwater Pollution Prevention Plan (SWPPP) will be provided prior to construction. The SWPPP report is modeled under the guidelines of Volume II, Section 3 of the 2014 Stormwater Management Manual for Western Washington. Construction SWPPP Elements #1 through #13 are addressed below.

#### *Element #1 – Mark Clearing Limits*

All clearing limits will be delineated with high visibility plastic fence and/or silt fence. See sheets ER-01 of the preliminary plans for locations and details.

#### *Element #2 – Establish Construction Access*

Stabilized construction accesses will be installed as shown on the preliminary plans. See sheets ER-01 and ER-02 of the construction plans for locations and details.

#### *Element #3 – Control Flow Rates*

Detention of construction period runoff will be provided by means of a sediment pond located at the northern portion of the site. See sheets ER-01 of the preliminary plans for location and details for flow and sediment control BMP's.

#### *Element #4 – Install Sediment Controls*

Silt fence, catch basin protection, and the temporary sediment pond will be utilized to contain sediments within the project's clearing limits. See sheets ER-01 and ER-02 of the preliminary plans for locations and details.

#### *Element #5 – Stabilize Soils*

Exposed soils will be stabilized as specified in the Grading and Erosion Control Notes with temporary and permanent seeding, mulching, and plastic covering. See sheet ER-02 of the preliminary plans for notes.

#### *Element #6 – Protect Slopes*

Slopes are minor on the subject site. Slopes shall be protected as specified under Element #5.

#### *Element #7 – Protect Drain Inlets*

Storm drain inlet protection will be utilized to contain sediments within the project's clearing limits. See sheets ER-01 and ER-02 of the preliminary plans for locations and details.

#### *Element #8 – Stabilize Channels and Outlets*

Temporary channels, shall be stabilized with check dams. See sheets ER-01 and ER-02 of the preliminary plans for locations and details.

#### *Element #9 – Control Pollutants*

Pollutants shall be controlled as specified in Volume IV of the 2014 DOE Manual—Source Control BMPs to address potential sources of pollution which may exacerbate possible soil/groundwater contamination identified onsite.

#### *Element #10 – Control De-Watering*

There will be no de-watering as a part of this project. See sheet ER-02 of the preliminary plans for notes.

#### *Element #11 – Maintain BMPs*

Maintenance of the BMPs is specified within the Construction Sequence and Grading and Erosion Control Notes. See sheets ER-01 and ER-02 of the preliminary plans for the Construction Sequence and notes.

Element #12: Manage the Project

The Grading and Erosion Control Notes specify seasonal work limitations. Maintenance of the BMPs is specified within the Construction Sequence and Grading and Erosion Control Notes. See sheets ER-01 and ER-02 of the preliminary plans for the Construction Sequence and notes.

Element #13: Protect on-site stormwater management BMPs

On-site stormwater management BMPs used for runoff from roofs and other hard surfaces are not feasible due to soil conditions and proposed project density.

## **SECTION 3: DOWNSTREAM ANALYSIS**

### **Task 1. Study Area Definition and Maps**

Snohomish County Bare Earth LiDAR, survey, and 2021 aerial photography were the best topographical references available for the area containing the site. The limits of the downstream analysis extend roughly 0.25 miles beyond the subject property's natural discharge location.

### **Task 2. Resource Review**

All of the resources below have been reviewed for existing and potential issues near the project site:

#### Adopted Basin Plans

No Adopted Basin Plans were located that include the project site.

#### Drainage Basin

This site is in the Allen Creek subbasin, within the Snohomish watershed. Discharge from the proposed development will discharge into Grace Creek, a tributary of Allen Creek, which eventually discharges into Ebey Slough.

#### Floodplain / Floodway (FEMA) maps

Per FEMA Floodplain map #53061C0736F the subject property is not within a floodplain.

#### Critical Areas Map

No critical areas have been identified on, or immediately adjacent to, the project site.

#### Drainage Complaints

No relevant issues were identified near the proposed site.

#### Road Drainage Problems

No issues were identified near the proposed site.

#### Soil Survey

Site soils are classified as Norma loam (0 to 3 percent slopes) which is classified as a Hydrologic Soil Group B/D type soil and Tokul gravelly medial loam (0 to 30 percent slopes) which is classified as a Hydrologic Soil Group B type soil.

#### Wetland Inventory Maps

Wetlands are identified to be on, or immediately adjacent to, the project site. Reference the critical areas report submitted with this report for additional information regarding the wetland areas onsite.

#### Migrating River Studies

Migrating River Studies are not considered applicable to the proposed development.

#### Section 303d List of Polluted Waters

Washington State Department of Ecology's Water Quality Assessment for Washington contains no listings for the Grace Creek upstream and downstream of the project.

#### Water Quality Problems

Grace Creek has no listings in the DOE Water Quality Assessment Review tools. No water quality problems were identified which would be exacerbated by the proposed development.

#### Stormwater Compliance Plans

Not applicable to the proposed project.

**Task 3. Field Inspection/Downstream Analysis**

On June 27<sup>th</sup>, 2022, a Downstream Analysis was performed at the site. The weather consisted of 84 °F and sunny skies. The following observations were verified during the visit.

The subject property areas consist primarily of lawn and forested area. There is a partially developed area in the existing condition with a gravel road leading to a cellular tower in the eastern portion of the site and a steel shipping container in the mid-western portion.

A flow path has been identified flowing from the southeast to the northwest within the threshold discharge area. Runoff generated onsite and within the 700 ft 60<sup>th</sup> St NE frontage collects within the wetland in the southwest portion of the site before continuing northwest into Grace Creek, a tributary of Allen Creek. The flowpath leaves the site and continues north west about 1200 ft before passing underneath 64th St NE through a culvert. The flow then continues north and west past the ¼-mile boundary of this analysis. See Figure 3.0, "Downstream Analysis Map" in Appendix 3 for a visual representation of current discharge.

A small amount of upstream flow occurs from the west along 60<sup>th</sup> St NE and upgradient vegetated area to the west (see image 2). This area drains to the wetland low point onsite and conveys north and west following the same flow path. None of this upstream area will be collected or captured by project improvements.

**Task 4. Drainage System Description and Problem Descriptions**

Based on the information available and all the resources available including visual inspection of the downstream flow path to the ¼-mile boundary, there is no evidence of existing or anticipated downstream drainage problems. All flows are adequately carried through natural channels to Ebey Slough.

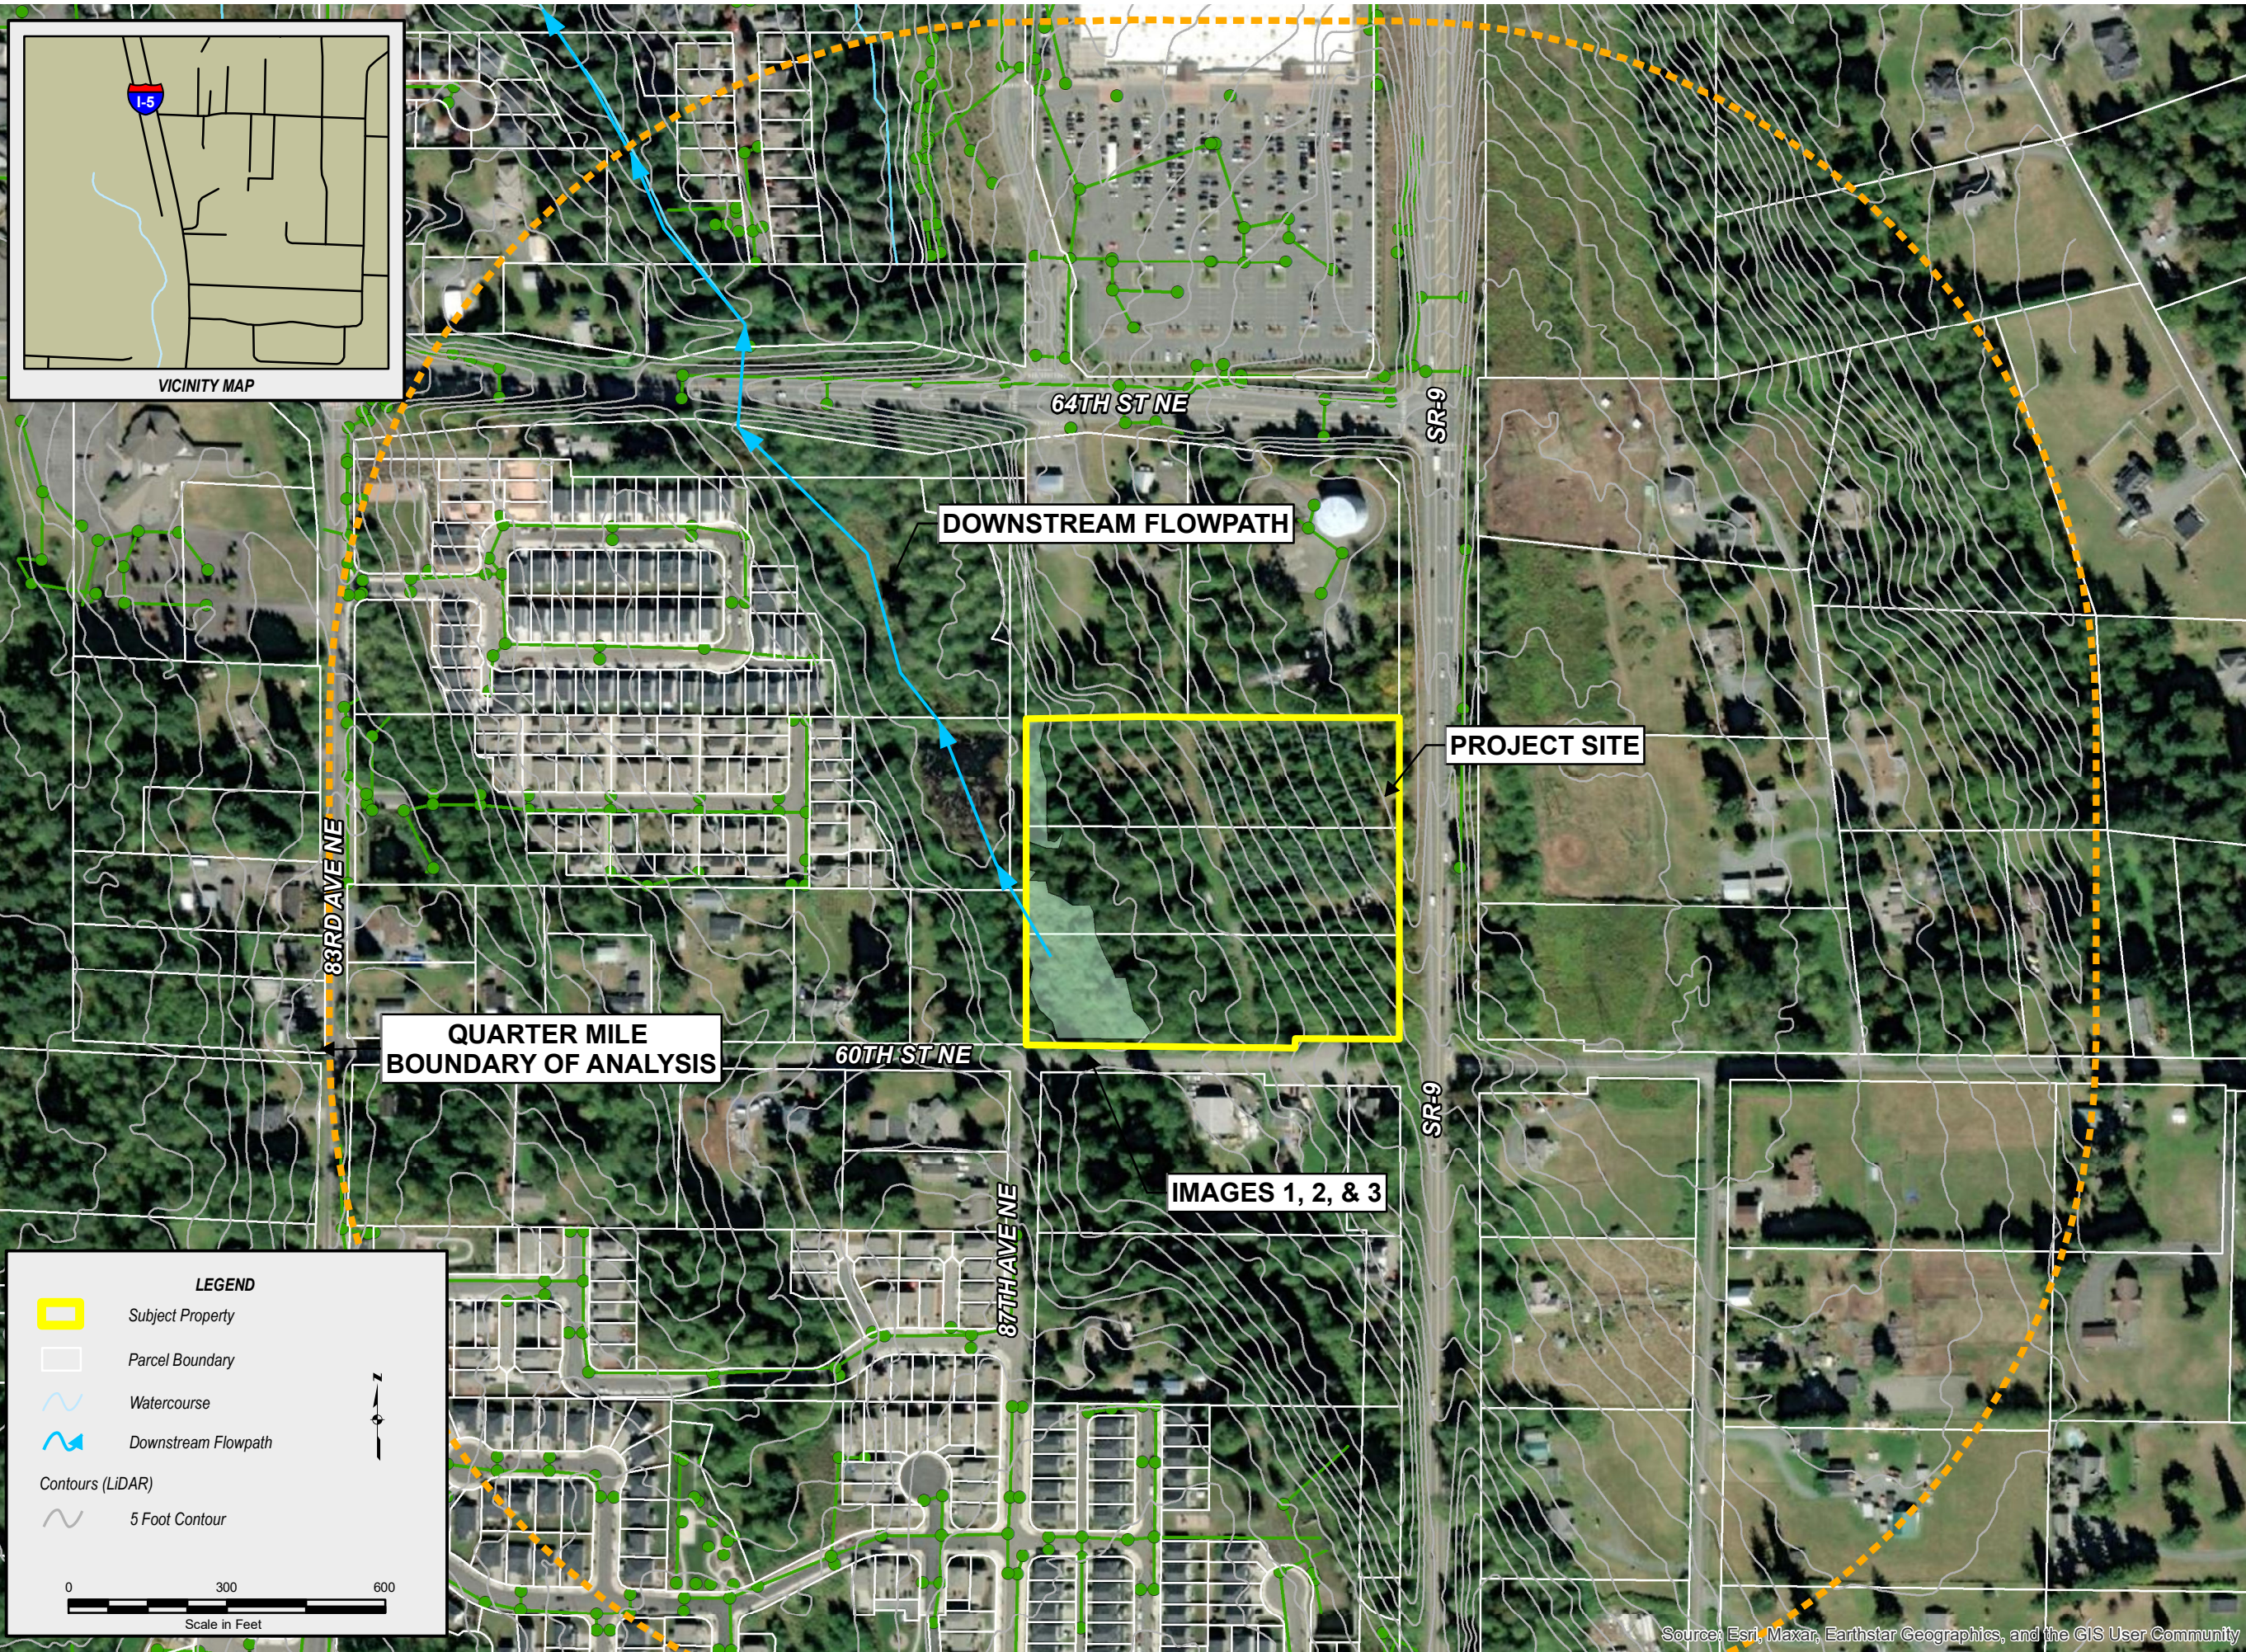

**Task 5. Mitigation of Existing or Potential Drainage Problems**

No evidence of existing or potential problems with downstream drainage conveyance infrastructure was found. Mitigation is not required.

## MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

**Warning:** Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service

Web Soil Survey URL:

Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Snohomish County Area, Washington

Survey Area Data: Version 23, Aug 31, 2021

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Aug 16, 2020—Aug 19, 2020

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

## Map Unit Legend

The pin displayed on the map is an approximate point selected by the user and does not represent an authoritative property location.

This map complies with FEMA's standards for the use of digital flood maps if it is not void as described below. The basemap shown complies with FEMA's basemap accuracy standards

The flood hazard information is derived directly from the authoritative NFHL web services provided by FEMA. This map was exported on **1/25/2023 at 11:30 AM** and does not reflect changes or amendments subsequent to this date and time. The NFHL and effective information may change or become superseded by new data over time.

This map image is void if the one or more of the following map elements do not appear: basemap imagery, flood zone labels, legend, scale bar, map creation date, community identifiers, FIRM panel number, and FIRM effective date. Map images for unmapped and unmodernized areas cannot be used for regulatory purposes.

**SECTION 4: DETENTION AND WATER QUALITY TREATMENT DESIGN**

**4.1 Pre-Developed Hydrology/Land Cover**

The pre-developed and developed conditions were modeled in WWHM for the purpose of peak flow determination for direct discharge. Based on the site location, the WWHM used the Everett Gage and a Precipitation Scale factor of 1.2.

Onsite Basin:

The predeveloped condition applied to the Onsite and Bypass Basins, modeled as a combined single basin. It does not include the wetland buffer area onsite that will not be disturbed for development. For visual representation of the listed basins, see Figure 4.0, "Predeveloped Hydrology Map". The values as modeled in WWHM are as follows:

*Table 1: Predeveloped Conditions: Onsite Basin*

<b>Onsite Basin</b>	
<u>Ground Cover</u>	<u>Area (acre)</u>
Forest, mod	1.31
Forest, steep	5.77
<b>Total</b>	<b>7.08</b>

**4.2 Developed Site Hydrology**

In the developed condition, the project will develop 44 single-family lots and associated driveways and utilities. Frontage improvements, including pavement widening and construction of pedestrian facilities, will be constructed along 60<sup>th</sup> St NE.

In compliance with the 2014 DOE Manual, all runoff from onsite developed/disturbed surfaces will be collected, treated, and discharged directly to existing/historic flow paths.

Onsite Basin:

The developed Onsite Basin is 6.43 acres comprised of a 44 single family lots, open spaces, and ROW. A 70% impervious lot coverage assumption per lot was used. In the developed condition, the Onsite Basin has been modeled using WWHM with the following areas and ground cover designations:

*Table 2: Developed Conditions: Onsite Basin*

<b>Onsite Basin</b>	
<u>Ground Cover</u>	<u>Area (acre)</u>
Roof tops	2.43
Roads, flat	1.26
Driveway, flat	0.40
Sidewalks, flat	0.46
Pasture, flat	1.88
<b>Total</b>	<b>6.43</b>

Bypass Basin:

The developed Bypass Basin is 0.65 acres and is comprised of proposed frontage improvements along 60<sup>th</sup> St NE, including pavement widening, planters, and pedestrian accesses along with some onsite ROW area. A portion of the lawn area on the west edge of lots 26-30 cannot be collected due to vertical constraints. This area has been added to the frontage bypass to make up the 0.20 acres of pasture in the model. The Bypass Basin cannot be collected due to topographical constraints. The Bypass Basin was modeled using WWHM with the following areas and ground cover designations:

Table 3: Developed Conditions: Bypass Basin

<b>Bypass Basin</b>	
<u>Ground Cover</u>	<u>Area (acre)</u>
Roads, flat	0.28
Sidewalk, flat	0.17
Pasture, Flat	0.20
<b>Total</b>	<b>0.65</b>

**4.3 Detention Facility Design**

The proposed detention vault facility used for mitigating developed condition flows was designed in compliance with 2014 DOE requirements to model hydrologic conditions and detention in a continuous runoff model (WWHM2012) where the following evaluation parameters are employed:

*"Flow duration is computed by counting the number of flow values that exceed a specified flow level. The specified flow levels used by WWHM in the flow duration analysis are listed below.*

1. 50% of the 2-year predevelopment peak flow.
2. 100% of the 2-year predevelopment peak flow.
3. 100% of the 50-year predevelopment peak flow.

*There are three criteria by which flow duration values are compared:*

1. *If the postdevelopment flow duration values exceed any of the predevelopment flow levels between 50% and 100% of the 2-year predevelopment peak flow values (100 Percent Threshold) then the flow duration requirement has not been met.*
2. *If the postdevelopment flow duration values exceed any of the predevelopment flow levels between 100% of the 2-year and 100% of the 50-year predevelopment peak flow values more than 10 percent of the time (110 Percent Threshold) then the flow duration requirement has not been met.*
3. *If more than 50 percent of the flow duration levels exceed the 100 percent threshold then the flow duration requirement has not been met."*

Detention Vault Facility

The proposed detention facility detains, and releases collected storm water runoff from the Onsite Basin. The facility is located within Tract 998 in the northwestern corner of the site. Flows from the Onsite Basin are collected and conveyed to the detention vault via a proposed network of catch basins and storm water conveyance pipes. Detailed WWHM output is provided in Appendix 4. A summary of the detailed statistics and inputs used for modeling the system in WWHM2012 can be found below.

Table 4: Detention Vault Design Summary

<b>Detention Vault</b>	
Live Storage Bottom Area (modeled)	10,140 SF
Live Storage Bottom Area (provided)	10,168 SF
Number of Cells	8
Cell Dimensions	4 ea x 15.5' x 68' & 4 ea x 15.5' x 96'
Begin Live Storage Elevation	401.00
Riser Height	8.00'
Volume (modeled)	81,120 CF
Volume (provided)	81,344 CF
Top of Riser Elevation	409.00
Top Outside of Vault Elevation	410.50

See table below for the flow rates and water surface elevations by storm event for the detention vault.

Table 5: Flow Rates and Water Surface Elevations by Storm Event

<b>Storm Event</b>	<b>Predeveloped Rate (cfs)</b>	<b>Mitigated Rates (cfs)</b>	<b>Water Surface Elevation (ft)</b>
2-Year	0.3515	0.3526	405.73
10-Year	0.7600	0.5693	407.25
50-Year	1.3064	0.8121	409.02
100-Year	1.6045	0.9322	409.06

#### 4.4 Water Quality Treatment

##### Perkfilter

Water Quality Treatment for the Onsite Basin is accomplished through a Perkfilter structure located downstream of the detention vault. A summary of design criteria is provided below:

Table 6: Perkfilter Design Summary

<b>Ø Perkfilter Vault</b>	
Tributary Area	6.43 AC
Tributary PGIS Area	1.66 AC
Water Quality Flow Rate (2 yr mitigated peak)	0.1780 cfs
WQ Treatment Capacity	0.1900 cfs
Number of Cartridges	7
Cartridge Height	12"
Internal Drop	1.7'
Peak Flow Rate	0.9322 cfs
Peak Flow Storm Event	100-year

##### Modular Wetland

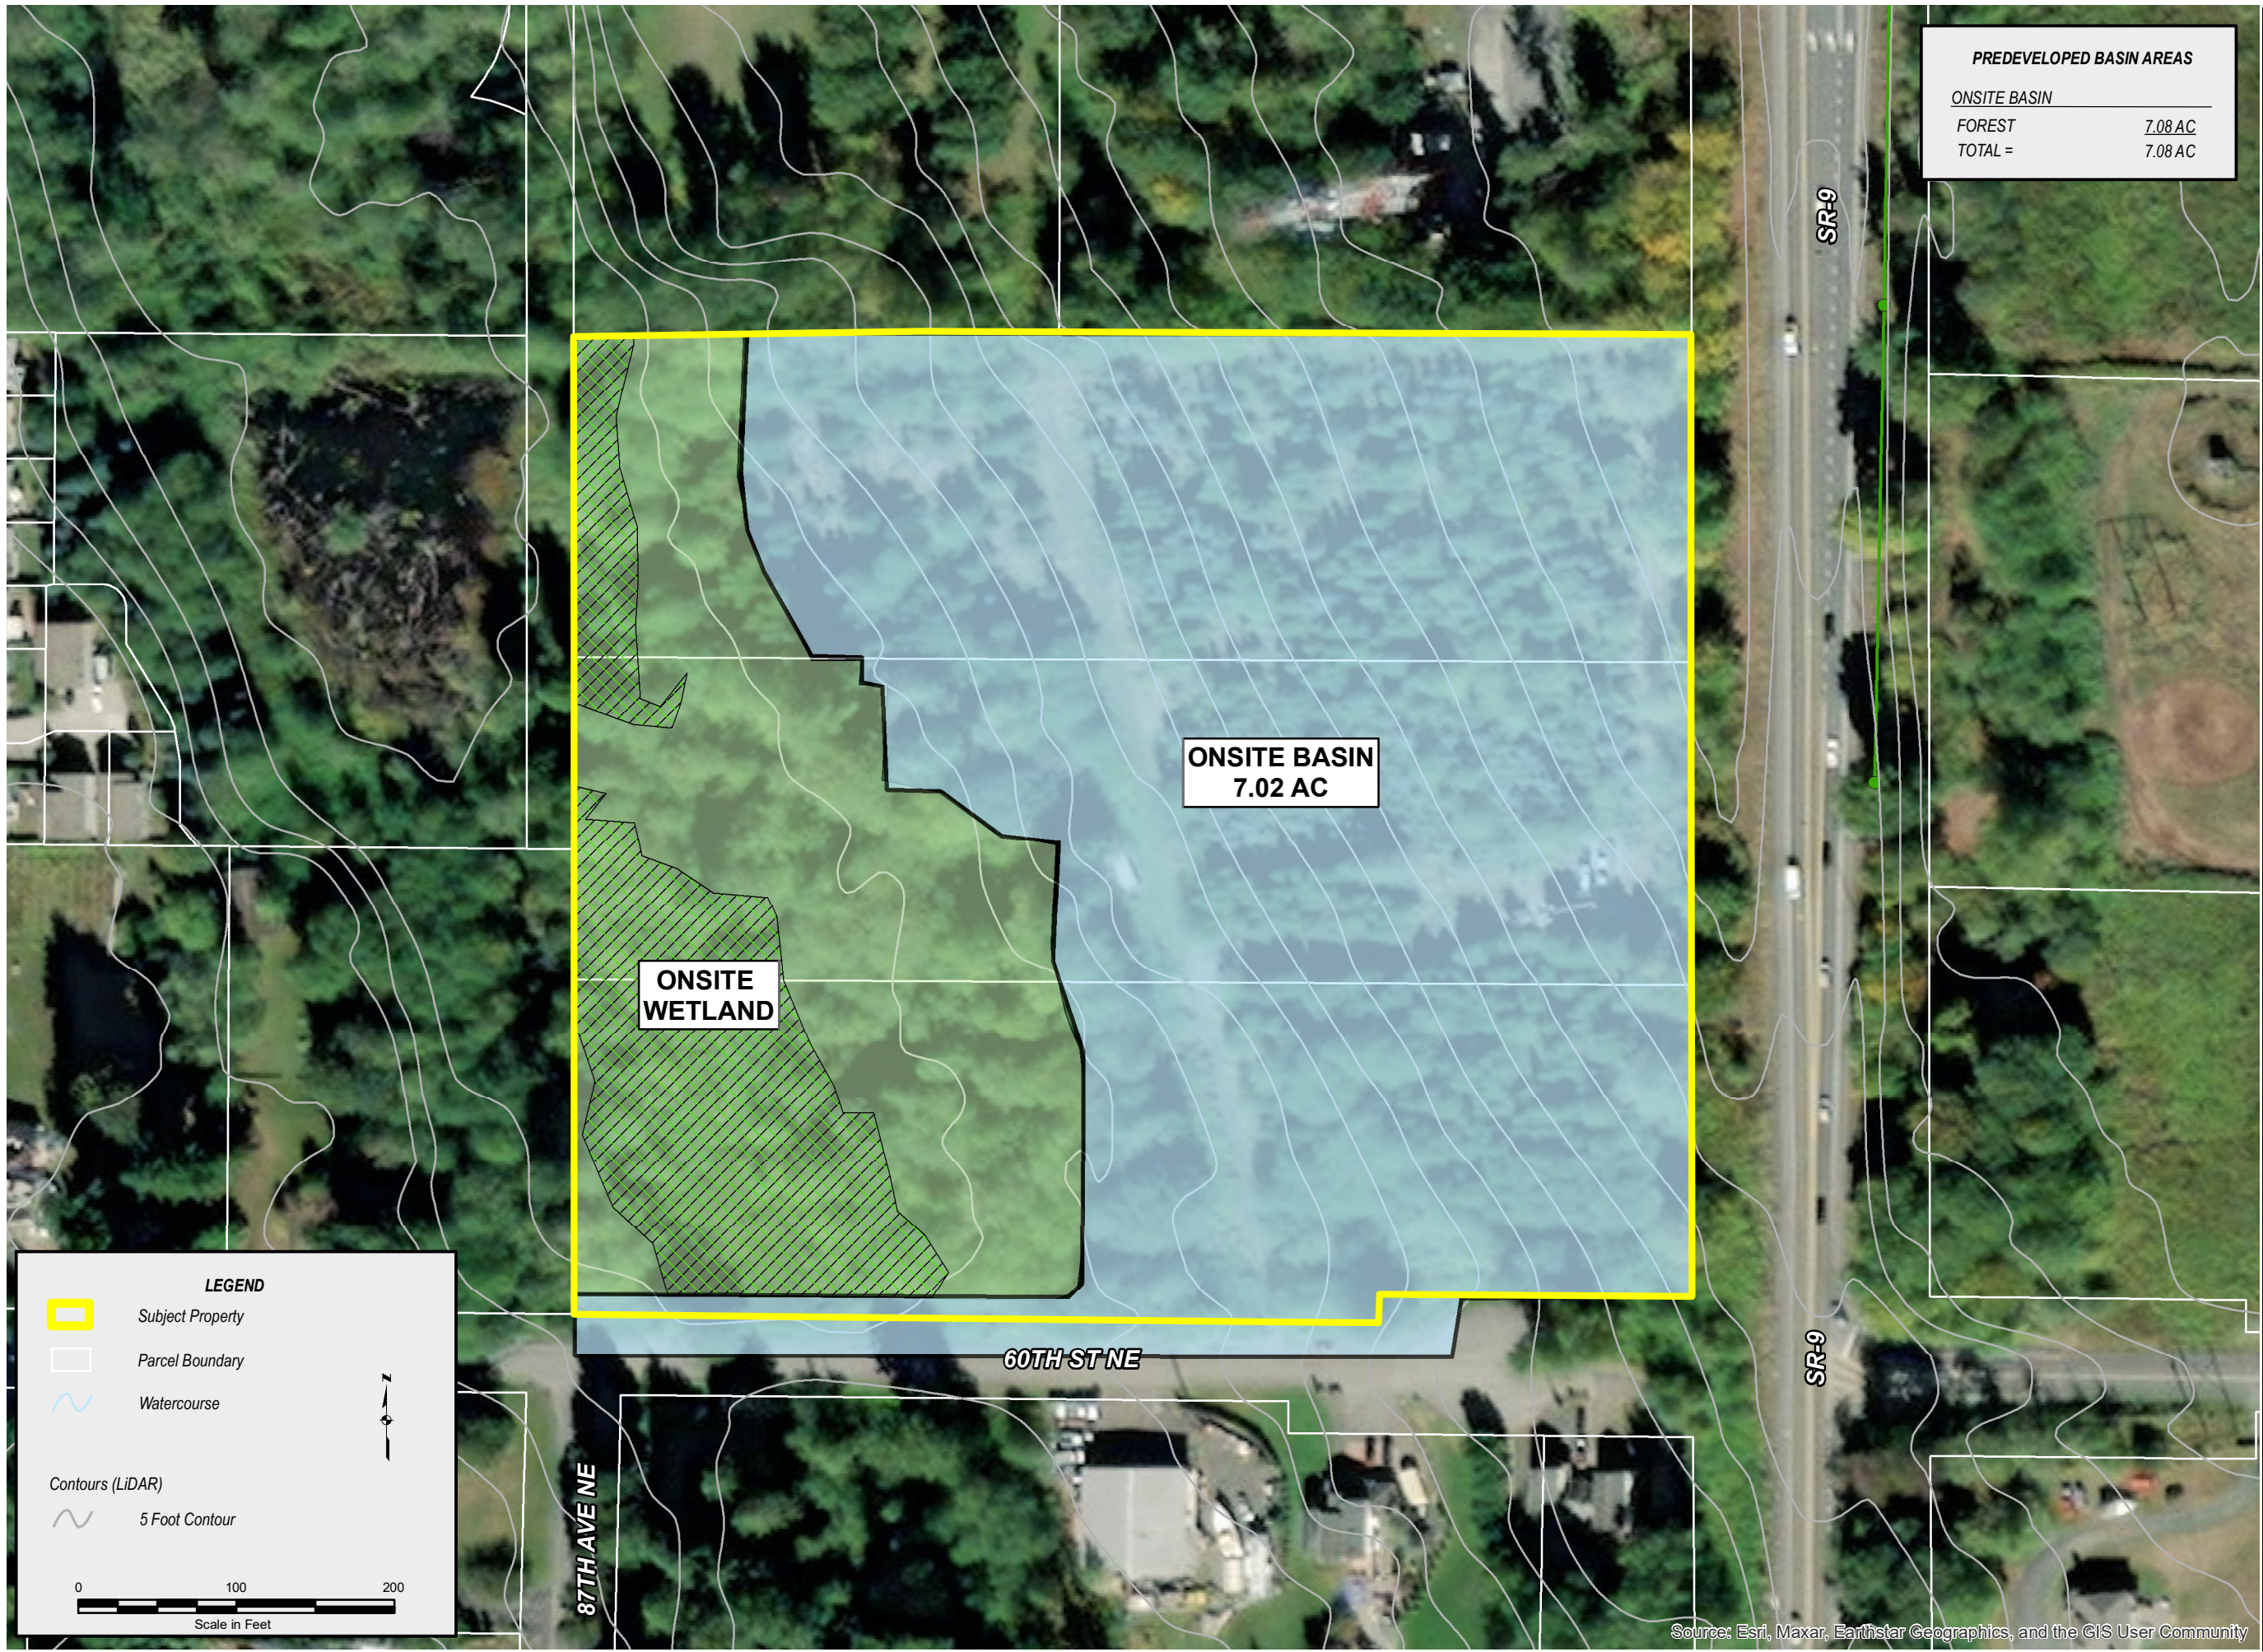

Water Quality Treatment for the Bypass Basin is accomplished through a Modular Wetland structure located in Tract 991. The Modular Wetland treats all stormwater that cannot be collected by the detention vault prior to discharge. A summary of design criteria is provided below:

Table 7: Modular Wetland Design Summary

<b>Modular Wetland</b>	
Tributary Area	0.65 AC
Tributary PGIS Area	0.28 AC
Water Quality Flow Rate (91% of total volume)	0.0840 cfs
WQ Treatment Capacity	0.103 cfs
Number of Cartridges	N/A
Cartridge Height	N/A
Internal Drop	0.5'
Peak Flow Rate	0.6465 cfs
Peak Flow Storm Event	100-year

2X Ø36.00" BOLTED & GASKETED ACCESS COVERS. RISERS & SLAB T&G IMPRESSIONS AS REQUIRED. FIELD POURED CONCRETE COLLAR REQUIRED, BY OTHERS. SEE NOTE 2.

Notes:

1. Precast concrete structure shall be manufactured in accordance with ASTM Designation C857 and C858.
2. Filter system shall be supplied with traffic rated (H20) bolted & gasketed Ø36" circular access covers with risers as required. Shallow applications may require configurations with (H20) bolted & gasketed square/rectangular access hatches. Field poured concrete collars required, by others.
3. Inlet & outlet pipe(s) (Ø 18" maximum) may enter device on all three sides of the inlet & outlet chambers respectively.
4. Inlet chamber shall be supplied with a drain-down device designed to remove standing water between storm events.
5. For depths less than specified minimums contact Oldcastle® Stormwater Solutions for engineering assistance.

**INSTALLATION NOTES**

1. CONTRACTOR TO PROVIDE ALL LABOR, EQUIPMENT, MATERIALS AND INCIDENTALS REQUIRED TO OFFLOAD AND INSTALL THE SYSTEM AND APPURTENANCES IN ACCORDANCE WITH THIS DRAWING AND THE MANUFACTURERS' SPECIFICATIONS, UNLESS OTHERWISE STATED IN MANUFACTURER'S CONTRACT.
2. UNIT MUST BE INSTALLED ON LEVEL BASE. MANUFACTURER RECOMMENDS A MINIMUM 6" LEVEL ROCK BASE UNLESS SPECIFIED BY THE PROJECT ENGINEER. CONTRACTOR IS RESPONSIBLE FOR VERIFYING PROJECT ENGINEER'S RECOMMENDED BASE SPECIFICATIONS.
4. CONTRACTOR TO SUPPLY AND INSTALL ALL EXTERNAL CONNECTING PIPES. ALL PIPES MUST BE FLUSH WITH INSIDE SURFACE OF CONCRETE (PIPES CANNOT INTRUDE BEYOND FLUSH). INVERT OF OUTFLOW PIPE MUST BE FLUSH WITH DISCHARGE CHAMBER FLOOR. ALL PIPES SHALL BE SEALED WATERTIGHT PER MANUFACTURER'S STANDARD CONNECTION DETAIL.
5. CONTRACTOR RESPONSIBLE FOR INSTALLATION OF ALL PIPES, RISERS, MANHOLES, AND HATCHES. CONTRACTOR TO GROUT ALL MANHOLES AND HATCHES TO MATCH FINISHED SURFACE UNLESS SPECIFIED OTHERWISE.
6. VEGETATION SUPPLIED AND INSTALLED BY OTHERS. ALL UNITS WITH VEGETATION MUST HAVE DRIP OR SPRAY IRRIGATION SUPPLIED AND INSTALLED BY OTHERS.
7. CONTRACTOR RESPONSIBLE FOR CONTACTING BIO CLEAN FOR ACTIVATION OF UNIT. MANUFACTURER'S WARRANTY IS VOID WITHOUT PROPER ACTIVATION BY A BIO CLEAN REPRESENTATIVE.

**GENERAL NOTES**

1. MANUFACTURER TO PROVIDE ALL MATERIALS UNLESS OTHERWISE NOTED.
2. ALL DIMENSIONS, ELEVATIONS, SPECIFICATIONS AND CAPACITIES ARE SUBJECT TO CHANGE. FOR PROJECT SPECIFIC DRAWINGS DETAILING EXACT DIMENSIONS, WEIGHTS AND ACCESSORIES PLEASE CONTACT BIO CLEAN.

**INTERNAL BYPASS DISCLOSURE:**

THE DESIGN AND CAPACITY OF THE PEAK CONVEYANCE METHOD TO BE REVIEWED AND APPROVED BY THE ENGINEER OF RECORD. HGL(S) AT PEAK FLOW SHALL BE ASSESSED TO ENSURE NO UPSTREAM FLOODING. PEAK HGL AND BYPASS CAPACITY SHOWN ON DRAWING ARE USED FOR GUIDANCE ONLY.

## **SECTION 5: CONVEYANCE DESIGN**

The stormwater conveyance system is comprised of a network of open/closed grate catch basins, buried pipe, a concrete detention vault and a Perfilter water quality vault, and the discharge to the existing wetland. Catch basins have been located such that each section of storm drainage pipe may adequately convey associated tributary area flows. All storm pipe located within the proposed private road was sized at the minimum diameter in accordance with the conveyance analysis.

The conveyance system was designed for the 100-year, 24-hour storm event, using the Rational Method with Everett IDF Tables. The Uniform Flow Method (Manning's Equation) was utilized to ensure that during the 100-year, 24-hour storm event, no catch basin structures would be overtopping. Conveyance analysis for the drainage system was completed using StormShed3G. See Appendix 5 for full StormShed output data as well as a visual representation of contributing conveyance basins.

The following catch basin summary table demonstrates that no catch basin structures overtop for the detention tributary drainage lines in the 100-year design storm event:

### **Vault Discharge Line**

A conveyance capacity calculation was performed using Manning's Equation on the shallowest pipe slope (CB-2 to CB-1) within the detention discharge line to verify pipe capacity in the 100-year unmitigated storm event. A summary evaluation of pipe capacity, offered below, demonstrates compliance in an overtopping condition where the full 100-year peak flow is conveyed through the discharge line. The calculations associated with this evaluation can be found in Appendix 5.

CB-2 to CB-1:

100-Year Peak Flow Rate:	6.508 cfs (WWHM2012 - 701 Series)
Pipe Diameter:	18"
Minimum Slope:	1.00%
Pipe Flow Depth:	100%
Pipe Flow Capacity:	8.26 cfs
Evaluation:	System Adequate

**Appendix 5: Conveyance Analysis**

1. StormShed3G Output Data
2. Manning's Analysis: Vault Discharge

Appended on: Wednesday, October 12, 2022 10:17:34 AM

**Node and Reach invert report**

<b>Open Channel Flow Calculator For Circular Pipes</b>	<b>Land Development Consultants, Inc.</b>	
	14201 NE 200th St. Ste. 100 Woodinville, WA 98072	Tel: (425) 806-1869 Fax: (425) 482-2893

Project Name: Brodie Plat  
 Description: Vault Outfall Conveyance

Project No.: C22-177  
 Date: 10/12/2022  
 Calc. By: RKF

Pipe Diameter (D) = 18 in  
 Pipe Slope (S) = 1.00 %  
 Flow Depth (y) = 1.00 ft  
**Flowrate (Q) = 8.26 cfs**  
 Mannings Coeff. (n) = 0.013  
 Theta Angle ( $\theta$ ) = 3.82 rad  
 Wetted Area (A) = 1.25 ft<sup>2</sup>  
 Wet. Perimeter (P) = 2.87 ft  
 Hydraulic Radius (R) = 0.44 ft  
 Top Width (T) = 1.41 ft  
 Flow Velocity = 6.60 fps

**Formulas:**

Theta Angle ( $\theta$ ): If  $y \geq r$ :  $\theta = 2\pi - 2a \cos\left(\frac{y-r}{r}\right)$  where: r = Pipe Radius

If  $y \leq r$ :  $\theta = 2a \cos\left(\frac{r-y}{r}\right)$  where: r = Pipe Radius

Wetted Area (A):  $A = \frac{1}{8}(\theta - \sin \theta)d^2$

Wetted Perimeter (P):  $P = \frac{1}{2}\theta d$

Hydraulic Radius (R):  $R = \frac{A}{P}$

Top Width (T):  $T = \sin\left(\frac{\theta}{2}\right)d$

## **SECTION 6: OPERATIONS AND MAINTENANCE MANUAL**

The proposed storm drainage system consists of buried pipes, catch basins, a detention vault, and a perfilter water quality treatment structure and a modular wetland water quality treatment structure. These facilities will require periodic maintenance and inspection. Inspection and maintenance procedures are contained on the following pages.

<b>NO. 5 – CATCH BASINS AND MANHOLES</b>			
<b>Maintenance Component</b>	<b>Defect or Problem</b>	<b>Condition When Maintenance is Needed</b>	<b>Results Expected When Maintenance is Performed</b>
Structure	Sediment	Sediment exceeds 60% of the depth from the bottom of the catch basin to the invert of the lowest pipe into or out of the catch basin or is within 6 inches of the invert of the lowest pipe into or out of the catch basin.	Sump of catch basin contains no sediment.
	Trash and debris	Trash or debris of more than ½ cubic foot which is located immediately in front of the catch basin opening or is blocking capacity of the catch basin by more than 10%.	No Trash or debris blocking or potentially blocking entrance to catch basin.
		Trash or debris in the catch basin that exceeds 1/3 the depth from the bottom of basin to invert the lowest pipe into or out of the basin.	No trash or debris in the catch basin.
		Dead animals or vegetation that could generate odors that could cause complaints or dangerous gases (e.g., methane).	No dead animals or vegetation present within catch basin.
		Deposits of garbage exceeding 1 cubic foot in volume.	No condition present which would attract or support the breeding of insects or rodents.
	Damage to frame and/or top slab	Corner of frame extends more than ¾ inch past curb face into the street (If applicable).	Frame is even with curb.
		Top slab has holes larger than 2 square inches or cracks wider than ¼ inch.	Top slab is free of holes and cracks.
		Frame not sitting flush on top slab, i.e., separation of more than ¾ inch of the frame from the top slab.	Frame is sitting flush on top slab.
	Cracks in walls or bottom	Cracks wider than ½ inch and longer than 3 feet, any evidence of soil particles entering catch basin through cracks, or maintenance person judges that catch basin is unsound.	Catch basin is sealed and is structurally sound.
		Cracks wider than ½ inch and longer than 1 foot at the joint of any inlet/outlet pipe or any evidence of soil particles entering catch basin through cracks.	No cracks more than 1/4 inch wide at the joint of inlet/outlet pipe.
	Settlement/ misalignment	Catch basin has settled more than 1 inch or has rotated more than 2 inches out of alignment.	Basin replaced or repaired to design standards.
	Damaged pipe joints	Cracks wider than ½-inch at the joint of the inlet/outlet pipes or any evidence of soil entering the catch basin at the joint of the inlet/outlet pipes.	No cracks more than ¼-inch wide at the joint of inlet/outlet pipes.
	Contaminants and pollution	Any evidence of contaminants or pollution such as oil, gasoline, concrete slurries or paint.	Materials removed and disposed of according to applicable regulations. Source control BMPs implemented if appropriate. No contaminants present other than a surface oil film.
	Inlet/Outlet Pipe	Sediment accumulation	Sediment filling 20% or more of the pipe.
Trash and debris		Trash and debris accumulated in inlet/outlet pipes (includes floatables and non-floatables).	No trash or debris in pipes.
Damaged		Cracks wider than ½-inch at the joint of the inlet/outlet pipes or any evidence of soil entering at the joints of the inlet/outlet pipes.	No cracks more than ¼-inch wide at the joint of the inlet/outlet pipe.

<b>NO. 5 – CATCH BASINS AND MANHOLES</b>			
<b>Maintenance Component</b>	<b>Defect or Problem</b>	<b>Condition When Maintenance is Needed</b>	<b>Results Expected When Maintenance is Performed</b>
Metal Grates (Catch Basins)	Unsafe grate opening	Grate with opening wider than $\frac{7}{8}$ inch.	Grate opening meets design standards.
	Trash and debris	Trash and debris that is blocking more than 20% of grate surface.	Grate free of trash and debris. footnote to guidelines for disposal
	Damaged or missing	Grate missing or broken member(s) of the grate. <b>Any open structure requires urgent maintenance.</b>	Grate is in place and meets design standards.
Manhole Cover/Lid	Cover/lid not in place	Cover/lid is missing or only partially in place. <b>Any open structure requires urgent maintenance.</b>	Cover/lid protects opening to structure.
	Locking mechanism Not Working	Mechanism cannot be opened by one maintenance person with proper tools. Bolts cannot be seated. Self-locking cover/lid does not work.	Mechanism opens with proper tools.
	Cover/lid difficult to Remove	One maintenance person cannot remove cover/lid after applying 80 lbs. of lift.	Cover/lid can be removed and reinstalled by one maintenance person.

<b>NO. 6 – CONVEYANCE PIPES AND DITCHES</b>			
<b>Maintenance Component</b>	<b>Defect or Problem</b>	<b>Conditions When Maintenance is Needed</b>	<b>Results Expected When Maintenance is Performed</b>
Pipes	Sediment & debris accumulation	Accumulated sediment or debris that exceeds 20% of the diameter of the pipe.	Water flows freely through pipes.
	Vegetation/roots	Vegetation/roots that reduce free movement of water through pipes.	Water flows freely through pipes.
	Contaminants and pollution	Any evidence of contaminants or pollution such as oil, gasoline, concrete slurries or paint.	Materials removed and disposed of according to applicable regulations. Source control BMPs implemented if appropriate. No contaminants present other than a surface oil film.
	Damage to protective coating or corrosion	Protective coating is damaged; rust or corrosion is weakening the structural integrity of any part of pipe.	Pipe repaired or replaced.
	Damaged	Any dent that decreases the cross section area of pipe by more than 20% or is determined to have weakened structural integrity of the pipe.	Pipe repaired or replaced.
Ditches	Trash and debris	Trash and debris exceeds 1 cubic foot per 1,000 square feet of ditch and slopes.	Trash and debris cleared from ditches.
	Sediment accumulation	Accumulated sediment that exceeds 20% of the design depth.	Ditch cleaned/flushed of all sediment and debris so that it matches design.
	Noxious weeds	Any noxious or nuisance vegetation which may constitute a hazard to County personnel or the public.	Noxious and nuisance vegetation removed according to applicable regulations. No danger of noxious vegetation where County personnel or the public might normally be.
	Contaminants and pollution	Any evidence of contaminants or pollution such as oil, gasoline, concrete slurries or paint.	Materials removed and disposed of according to applicable regulations. Source control BMPs implemented if appropriate. No contaminants present other than a surface oil film.
	Vegetation	Vegetation that reduces free movement of water through ditches.	Water flows freely through ditches.
	Erosion damage to slopes	Any erosion observed on a ditch slope.	Slopes are not eroding.
	Rock lining out of place or missing (If Applicable)	One layer or less of rock exists above native soil area 5 square feet or more, any exposed native soil.	Replace rocks to design standards.

## Inspection and Maintenance Guide

---

# PerkFilter™ Media Filtration System

## Description

The PerkFilter is a stormwater treatment device used to remove pollutants from urban runoff. Impervious surfaces and other urban and suburban landscapes generate a variety of contaminants that can enter stormwater and pollute downstream receiving waters. The PerkFilter is a media-filled cartridge filtration device designed to capture and retain sediment, gross solids, metals, nutrients, hydrocarbons, and trash and debris. As with any stormwater treatment system, the PerkFilter requires periodic maintenance to sustain optimum system performance.

## Function

The PerkFilter is a water quality treatment system consisting of three chambers: an inlet chamber, a filter cartridge treatment chamber, and an outlet chamber (Figure 1). Stormwater runoff enters the inlet chamber through an inlet pipe, curb opening, or grated inlet. Gross solids are settled out, and floating trash and debris are trapped in the inlet chamber. Pretreated flow is then directed to the treatment chamber through an opening in the baffle wall between the inlet chamber and treatment chamber. The treatment chamber contains media-filled filter cartridges (Figure 2) that use physical and chemical processes to remove pollutants. During a storm event, runoff pools in the treatment chamber before passing radially through the cylindrical cartridges from the outside surface, through the media for treatment, and into the center of the cartridge. At the center of the cartridge is a center tube assembly designed to distribute the hydraulic load evenly across the surface of the filter cartridge and control the treatment flow rate. The center tube assembly discharges treated flow through the false floor and into the outlet chamber. A draindown feature built into each cartridge allows the treatment chamber to dewater between storm events.

Figure 1. Schematic of the PerkFilter system.

All PerkFilter systems include a high-flow bypass assembly to divert flow exceeding the treatment capacity of the filter cartridges around the treatment chamber. The bypass assembly routes peak flow from the inlet chamber directly to the outlet chamber, bypassing the treatment chamber to prevent sediment and other captured pollutants from being scoured and re-entrained by high flow. Treated flow and bypass flow merge in the outlet chamber for discharge by a single outlet pipe.

**Figure 2. Schematic of PerkFilter cartridge.**

## Configuration

The PerkFilter structure may consist of a vault, manhole, or catch basin configuration. Catch basin units may be fabricated from concrete or steel. Internal components including the PerkFilter cartridges are manufactured from durable plastic and stainless steel components and hardware. All cartridges are 18 inches in diameter and are available in two heights: 12-inch and 18-inch. Cartridges may be used alone or may be stacked (Figure 3) to provide 24-inch and 30-inch combinations. The capacity of each cartridge or cartridge combination is dictated by the allowable operating rate of the media and the outer surface area of the cartridge. Thus, taller cartridges have greater treatment capacity than shorter cartridges, but they also require more hydraulic drop across the system. Cartridges may be filled with various media depending on the target pollutants and desired treatment rate, among other factors.

Access to an installed PerkFilter system is typically provided by ductile iron castings or hatch covers. The location and number of access appurtenances is dependent on the size and configuration of the system.

**Figure 3. Schematic of stacked cartridges and connector components.**

## Maintenance Overview

State and local regulations require all stormwater management systems to be inspected on a periodic basis and maintained as necessary to ensure performance and protect downstream receiving waters. Maintenance prevents excessive pollutant buildup that can limit system performance by reducing the operating capacity and increasing the potential for scouring of pollutants during periods of high flow.

## Inspection and Maintenance Frequency

The PerkFilter should be inspected on a periodic basis, typically twice per year, and maintained as required. Initially, inspections of a new system should be conducted more frequently to help establish an appropriate site-specific inspection frequency. The maintenance frequency will be driven by the amount of runoff and pollutant loading encountered by a given system. In most cases, the optimum maintenance interval will be one to three years. Inspection and maintenance activities should be performed only during dry weather periods.

## Inspection Equipment

The following equipment is helpful when conducting PerkFilter inspections:

- Recording device (pen and paper form, voice recorder, iPad, etc.)
- Suitable clothing (appropriate footwear, gloves, hardhat, safety glasses, etc.)
- Traffic control equipment (cones, barricades, signage, flagging, etc.)
- Socket and wrench for bolt-down access covers
- Manhole hook or pry bar
- Flashlight
- Tape measure
- Measuring stick or sludge sampler
- Long-handled net (optional)

## Inspection Procedures

PerkFilter inspections are visual and may be conducted from the ground surface without entering the unit. To complete an inspection, safety measures including traffic control should be deployed before the access covers are removed. Once the covers have been removed, the following items should be checked and recorded (see form provided at the end of this document) to determine whether maintenance is required:

- Inspect the internal components and note whether there are any broken or missing parts. In the unlikely event that internal parts are broken or missing, contact Oldcastle Infrastructure at (800) 579-8819 to determine appropriate corrective action.
- Note whether the inlet pipe is blocked or obstructed. The outlet pipe is covered by a removable outlet hood and cannot be observed without entering the unit.
- Observe, quantify and record the accumulation of floating trash and debris in the inlet chamber. The significance of accumulated floating trash and debris is a matter of judgment. A long-handled net may be used to retrieve the bulk of trash and debris at the time of inspection if full maintenance due to accumulation of floating oils or settled sediment is not yet warranted.

- Observe, quantify and record the accumulation of oils in the inlet chamber. The significance of accumulated floating oils is a matter of judgment. However, if there is evidence of an oil or fuel spill, immediate maintenance by appropriate certified personnel is warranted.
- Observe, quantify and record the average accumulation of sediment in the inlet chamber and treatment chamber. A calibrated dipstick, tape measure, or sludge sampler may be used to determine the amount of accumulated sediment in each chamber. The depth of sediment may be determined by calculating the difference between the measurement from the rim of the PerkFilter to the top of the accumulated sediment, and the measurement from the rim of the PerkFilter to the bottom of the PerkFilter structure. Finding the top of the accumulated sediment below standing water takes some practice and a light touch, but increased resistance as the measuring device is lowered toward the bottom of the unit indicates the top of the accumulated sediment.
- Finally, observe, quantify and record the amount of standing water in the treatment chamber around the cartridges. If standing water is present, do not include the depth of sediment that may have settled out below the standing water in the measurement.

## **Maintenance Triggers**

Maintenance should be scheduled if any of the following conditions are identified during the inspection:

- Internal components are broken or missing.
- Inlet piping is obstructed.
- The accumulation of floating trash and debris that cannot be retrieved with a net and/or oil in the inlet chamber is significant.
- There is more than 6" of accumulated sediment in the inlet chamber.
- There is more than 4" of accumulated sediment in the treatment chamber.
- There is more than 4" of standing water in the treatment chamber more than 24 hours after end of rain event.
- A hazardous material release (e.g. automotive fluids) is observed or reported.
- The system has not been maintained for 3 years (wet climates) to 5 years (dry climates).

## **Maintenance Equipment**

The following equipment is helpful when conducting PerkFilter maintenance:

- Suitable clothing (appropriate footwear, gloves, hardhat, safety glasses, etc.)
- Traffic control equipment (cones, barricades, signage, flagging, etc.)
- Socket and wrench for bolt-down access covers
- Manhole hook or pry bar
- Confined space entry equipment, if needed
- Flashlight
- Tape measure
- 9/16" socket and wrench to remove hold-down struts and filter cartridge tops
- Replacement filter cartridges
- Vacuum truck with water supply and water jet

Contact Oldcastle Infrastructure at (800) 579-8819 for replacement filter cartridges. A lead time of four weeks is recommended.

## Maintenance Procedures

Maintenance should be conducted during dry weather when no flow is entering the system. Confined space entry is necessary to maintain vault and manhole PerkFilter configurations. Only personnel that are OSHA Confined Space Entry trained and certified may enter underground structures. Confined space entry is not required for catch basin PerkFilter configurations. Once safety measures such as traffic control are deployed, the access covers may be removed and the following activities may be conducted to complete maintenance:

- Remove floating trash, debris and oils from the water surface in the inlet chamber using the extension nozzle on the end of the boom hose of the vacuum truck. Continue using the vacuum truck to completely dewater the inlet chamber and evacuate all accumulated sediment from the inlet chamber. Some jetting may be required to fully remove sediment. The inlet chamber does not need to be refilled with water after maintenance is complete. The system will fill with water when the next storm event occurs.
- Remove the hold-down strut from each row of filter cartridges and then remove the top of each cartridge (the top is held on by four 9/16" bolts) and use the vacuum truck to evacuate the spent media. When empty, the spent cartridges may be easily lifted off their slip couplers and removed from the vault. The couplers may be left inserted into couplings cast into the false floor to prevent sediment and debris from being washed into the outlet chamber during washdown.
- Once all the spent cartridges have been removed from the structure, the vacuum truck may be used to evacuate all accumulated sediment from the treatment chamber. Some jetting may be required to fully remove sediment. Take care not to wash sediment and debris through the openings in the false floor and into the outlet chamber. All material removed from the PerkFilter during maintenance including the spent media must be disposed of in accordance with local, state, and/or federal regulations. In most cases, the material may be handled in the same manner as disposal of material removed from sumped catch basins or manholes.
- Place a fresh cartridge in each cartridge position using the existing slip couplers and urethane bottom caps. If the vault is equipped with stacked cartridges, the existing outer and inner interconnector couplers must be used between the stacked cartridges to provide hydraulic connection. Transfer the existing vent tubes from the spent cartridges to the fresh cartridges. Finally, refit the struts to hold the fresh cartridges in place.
- Securely replace access covers, as appropriate.
- Make arrangements to return the empty spent cartridges to Oldcastle Infrastructure.

## Modular Wetlands<sup>®</sup> Linear Operation & Maintenance Manual

## Maintenance Summary

- Remove Trash from Screening Device – average maintenance interval is 6 to 12 months.
  - (5 minute average service time ).
- Remove Sediment from Separation Chamber – average maintenance interval is 12 to 24 months.
  - (10 minute average service time ).
- Replace Cartridge Filter Media – average maintenance interval 12 to 24 months.
  - (10-15 minute per cartridge average service time ).
- Replace Drain Down Filter Media – average maintenance interval is 12 to 24 months.
  - (5 minute average service time ).
- Trim Vegetation – average maintenance interval is 6 to 12 months.
  - (Service time varies).

*System Diagram*

## **Maintenance Procedures**

### ***Screening Device***

1. Remove grate or manhole cover to gain access to the screening device in the Pre- Treatment Chamber. Vault type units do not have screening device. Maintenance can be performed without entry.
2. Remove all pollutants collected by the screening device. Removal can be done manually or with the use of a vacuum truck.
3. Screening device can easily be removed from the Pre-Treatment Chamber to gain access to separation chamber and media filters below. Replace grate or manhole cover when completed.

### ***Separation Chamber***

1. Perform maintenance procedures of screening device listed above before maintaining the separation chamber.
2. With a pressure washer, spray down pollutants accumulated on walls and cartridge filters.
3. Vacuum out Separation Chamber and remove all accumulated pollutants. Replace screening device, grate or manhole cover when completed.

### ***Cartridge Filters***

1. Perform maintenance procedures on screening device and separation chamber before maintaining cartridge filters.
2. Enter separation chamber.
3. Unscrew the two bolts holding the lid on each cartridge filter and remove lid.
4. Remove each of 4 to 8 media cages holding the media in place.
5. Spray down the cartridge filter to remove any accumulated pollutants.
6. Vacuum out old media and accumulated pollutants.
7. Reinstall media cages and fill with new media from manufacturer or outside supplier. Manufacturer will provide specification of media and sources to purchase.
8. Replace the lid and tighten down bolts. Replace screening device, grate or manhole cover when completed.

### ***Drain Down Filter***

1. Remove hatch or manhole cover over discharge chamber and enter chamber. Entry into chambers may require confined space training based on state and local regulations.
2. Unlock and lift drain down filter housing and remove old media block. Replace with new media block. Lower drain down filter housing and lock into place.
3. Exit chamber and replace hatch or manhole cover.

## Maintenance Notes

1. Following maintenance and/or inspection, it is recommended the maintenance operator prepare a maintenance/inspection record. The record should include any maintenance activities performed, amount and description of debris collected, and condition of the system and its various filter mechanisms.
2. The owner should keep maintenance/inspection record(s) for a minimum of five years from the date of maintenance. These records should be made available to the governing municipality for inspection upon request at any time.
3. Transport all debris, trash, organics and sediments to approved facility for disposal in accordance with local and state requirements.
4. Entry into chambers may require confined space training based on state and local regulations.
5. No fertilizer shall be used in the Biofiltration Chamber.
6. Irrigation should be provided as recommended by manufacturer and/or landscape architect. Amount of irrigation required is dependent on plant species. Some plants may require irrigation.

## Maintenance Procedure Illustration

### **Screening Device**

*The screening device is located directly under the manhole or grate over the Pre-Treatment Chamber. It's mounted directly underneath for easy access and cleaning. Device can be cleaned by hand or with a vacuum truck.*

### **Separation Chamber**

*The separation chamber is located directly beneath the screening device. It can be quickly cleaned using a vacuum truck or by hand. A pressure washer is useful to assist in the cleaning process.*

### **Cartridge Filters**

The cartridge filters are located in the Pre-Treatment chamber connected to the wall adjacent to the biofiltration chamber. The cartridges have removable tops to access the individual media filters. Once the cartridge is open media can be easily removed and replaced by hand or a vacuum truck.

### **Drain Down Filter**

The drain down filter is located in the Discharge Chamber. The drain filter unlocks from the wall mount and hinges up. Remove filter block and replace with new block.

### **Trim Vegetation**

Vegetation should be maintained in the same manner as surrounding vegetation and trimmed as needed. No fertilizer shall be used on the plants. Irrigation per the recommendation of the manufacturer and or landscape architect. Different types of vegetation requires different amounts of irrigation.

Modular Wetland System Type (Curb, Grate or UG Vault): \_\_\_\_\_ Size (22', 14' or etc.): \_\_\_\_\_

Structural Integrity:	Yes	No	Comments
Damage to pre-treatment access cover (manhole cover/grate) or cannot be opened using normal lifting pressure?			
Damage to discharge chamber access cover (manhole cover/grate) or cannot be opened using normal lifting pressure?			
Does the MWS unit show signs of structural deterioration (cracks in the wall, damage to frame)?			
Is the inlet/outlet pipe or drain down pipe damaged or otherwise not functioning properly?			
<b>Working Condition:</b>			
Is there evidence of illicit discharge or excessive oil, grease, or other automobile fluids entering and clogging the unit?			
Is there standing water in inappropriate areas after a dry period?			
Is the filter insert (if applicable) at capacity and/or is there an accumulation of debris/trash on the shelf system?			
Does the depth of sediment/trash/debris suggest a blockage of the inflow pipe, bypass or cartridge filter? If yes specify which one in the comments section. Note depth of accumulation in in pre-treatment chamber.			Depth: _____
Does the cartridge filter media need replacement in pre-treatment chamber and/or discharge chamber?			Chamber: _____
Any signs of improper functioning in the discharge chamber? Note issues in comments section.			
<b>Other Inspection Items:</b>			
Is there an accumulation of sediment/trash/debris in the wetland media (if applicable)?			
Is it evident that the plants are alive and healthy (if applicable)? Please note Plant Information below.			
Is there a septic or foul odor coming from inside the system?			

Waste:	Yes	No
